

Cloud Computing - Cyber Security Challenges for the Financial Sector

Recent developments in the Greek financial sector made cost cutting an imperative for all financial institutions. In this light, Cloud Computing appears as an attractive alternative compared to the old fashioned data centers that squeeze a lot of money out of the institution's budgets. After a presentation about the security challenges of Cloud Computing for the financial institutions from ENISA and a case study about a relevant implementation in a western European Bank from Microsoft, this round-table will discuss the maturity, the benefits and the risks of this technology together with participants from ISACA and the Hellenic Banking Association.

November 24, 2015
